

Tiber

BP · Keathley Canyon 102 · US Gulf of Mexico

ultra-HPHT · 20k vs 20k psi (0%)

4,132 ft

Water depth

\$5 B

Gross CAPEX

80 mbopd

Plateau rate

900 scf/bbl

GOR

100 %

Operator WI

PERFORMANCE SNAPSHOT

Production & performance figures are pending — this field is pre-production, so no oil has flowed yet. Rollout tracked in [#948](#).

LEASE & LANDMAN

Operator **BP** · WI BP 100% (op) · Blocks KC102

LEASE	DEPTH	DEV	STATUS
G25782	4,130 ft	subsea20	<u>pending</u>

Status, dates & per-lease detail pending the [BSEE lease ingest \(#959\)](#).

Provenance: Basis: in-repo tiber.yml (operator BP, plateau 80 mbopd, GOR 900 scf/bbl, data through 2024-12-31) plus public sources. BP discovered Tiber Sept 2009 in Keathley Canyon 102, 4,132 ft water. BP reached FID on the combined Tiber-Guadalupe hub 29 Sep 2025 (FID year=2025); Seatrium awarded FPU EPCC. Ownership is now 100% BP (original discovery split BP 62% / Petrobras 20% / ConocoPhillips 18% no longer reflects current WI). Status: execution (post-FID, construction underway). capex set to the sanctioned public figure of \$5.0bn for the Tiber-Guadalupe project (YAML's \$8bn was a pre-FID Tiber-only planning assumption); note \$5bn covers both fields. first oil left blank — oil has not flowed; projected first production is 2030. OPEX, not available (not publicly disclosed; the "\$3/bbl below Kaskida" figure is development cost, not opex). projected end-of-production and lease year (not confidently sourced).
